### ABSTRACT

A checklist of Disteniidae and Vesperidae (Coleoptera) within the present geographical frontier of Indian subcontinent up to 2016 is provided. As per the current checklist prepared, there are 15 longhorn beetle species classified under 4 tribes, 7 genera and two subfamilies under Disteniidae and Vesperidae. The report has accounted for 4.3% and 3.75% of species, respectively, from India as compared to global record. For all the species, accepted nomenclature followed by all relevant works reporting systematics, classification, synonyms, type locality and distribution within and outside India is provided.

### KEYWORDS

Disteniidae; Vesperidae; checklist; type locality; distribution

## Introduction

Cerambycidae is one of the biggest families of Coleoptera represented by more than 35,000 species described under 4000 genera (Lawrence 1982; Švácha and Lawrence 2014a). Among them, Indian biogeographical range comprises 1536 species, which are grouped under 72 tribes, 440 genera and nine subfamilies (Kariyanna et al. 2017).

Unlike Cerambycidae, Disteniidae and Vesperidae are poorly represented. The family Vesperidae comprises 17 described genera with nearly 80 species (Švácha and Lawrence 2014c). It is composed of relatively four different allopatric groups: Vesperinae, Philinae, Anoplodermatinae and the tribe Vesperoctenini of uncertain taxonomic position (Švácha et al. 1997).

The family Disteniidae Thomson 1861 currently contains over 300 species and four tribes. The members of this family are widely distributed, predominantly in tropical and subtropical, with only a few species penetrating into temperate areas and absent from New Zealand and Australia (Švácha and Lawrence 2014b).

## Materials and methods

The present study mainly referred the historical works by Gahan 1906; Gressitt and Rondon 1970; Hua 2002; Mukhopadhyay and Halder 2004; Villiers 1958; Thomson 1864; Weigel 2006; Švácha and Lawrence 2014a. The information for the checklist of Indian Disteniidae and Vesperidae was collected mainly from TITAN database of Cerambycidae world by Tavakilian and Chevillotte 2017 and from various primary and secondary sources of publications.

The current study included all the species of longhorn beetles belonging to Disteniidae and Vesperidae reported from India till date (Fig. 1), with

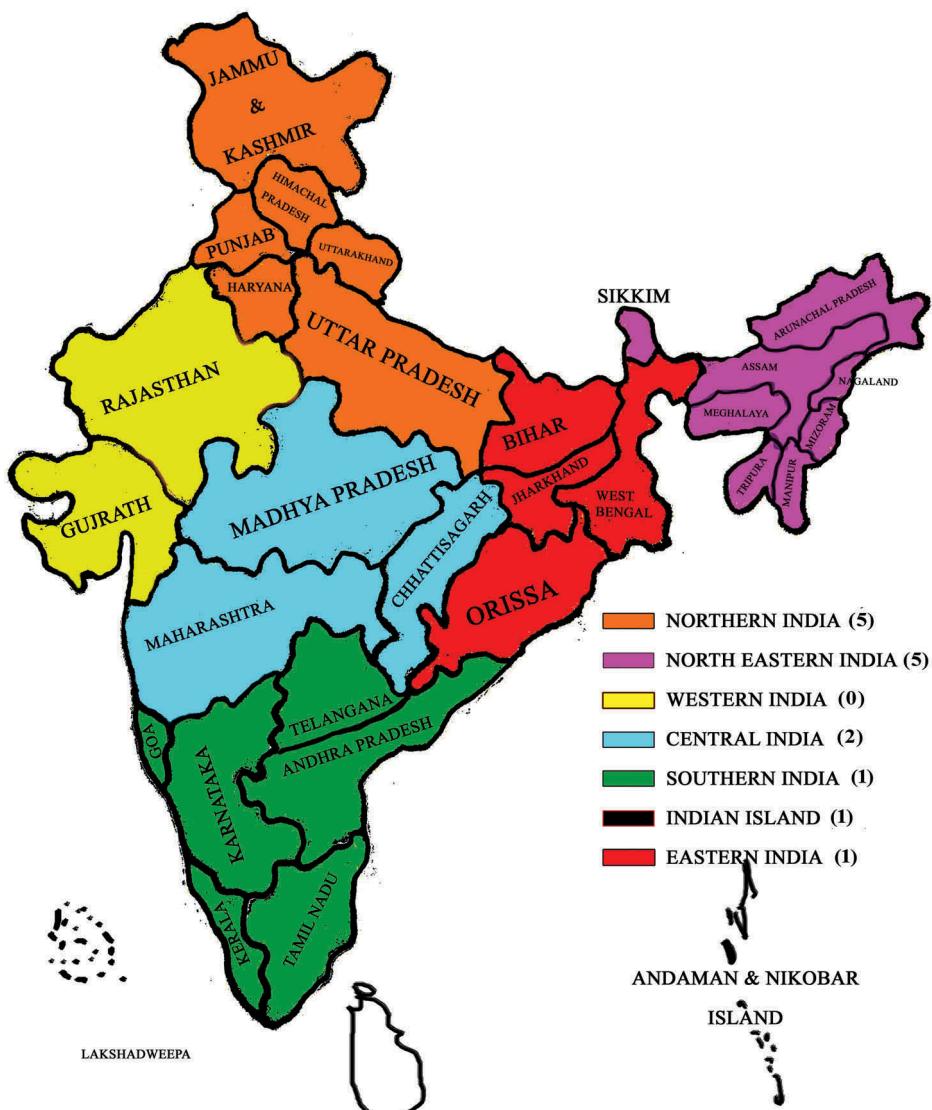

Figure 1. Species distribution of Disteniidae and Vesperidae from India.

complete information about valid name, synonyms, *type species*, year of description, category, type locality, *type species* deposition museum and distribution record.

The general format used in this checklist is as follows:

[Genus] [Author], [year]: [page of description] (*type species*: Genus species, Author, Year); [Genus] [Author], [year]: [page of description] [*type species*]

**[Species accepted name]**

**[Original combination]**: [page of description]

[Type locality]: [place of record] [Type] [Sex] [Museum Preserved]

[Synonym] [Author], [year]: [page of description]

[Type locality]: [place of record] [Type] [Sex] [Museum Preserved]

**[Published records]**: [Author], [year]: [page. # of description] [Species name]

**[Distribution]**: [India (States: Districts and regions)] [Other country: State and regions].

**Abbreviations:**

Cat. – Catalog

Des. – Designation

Distr. – Distribution

♀ – female

HT – Holotype

Intr. – Introduction

LT – Lectotype

♂ – male

m. id. – Misidentification

m. s. – Misspelling

Morp. – Morphology

MP – Madhya Pradesh

P. n. – Plant Nourishing/Plant Nutrient

ST – Syntype

TN – Tamil Nadu

UP – Uttar Pradesh

**List of institutions or private collections mentioned in the Checklist:**

Collection Carolus Holzschuh, Villach (CCH)

Museum Lugdunense Batavorum, Leiden (MLB) no longer extant

National Museum of Natural History, Paris (MNHN)

Royal Institute of Natural Sciences of Belgium (IRSNB)

Swedish Museum of Natural History, Stockholm (NHRS)

The Natural History Museum, London (BMNH)

## Results

The checklist prepared in the present study for the Indian Disteniidae and Vesperidae includes 15 longhorn beetle species classified under 4 (3 and 1) tribes, 7 (5 and 2) genera and two subfamilies.

The number of species recorded under every subfamily from India is: Disteniinae Thomson (1861) (13 species); Philinae Thomson (1861) (3 species). The tribes, Disteniini Thomson (1861) contain four species whereas Cyrtonopini Gressitt, 1940 and Philiini Thomson (1861) contain three species each. The subfamily-wise distribution of Indian genera is six under Disteniinae and two under Philinae.

A complete checklist with synonyms and bibliographic citations of all the species of Indian longhorn beetles were prepared. Out of 1551 Indian longhorn beetle species, three families *viz.*, Cerambycidae, Disteniidae and Vesperidae comprise of 1536, 13 and 2 species, respectively (Kariyanna 2016). The families Disteniidae and Vesperidae were traditionally treated within Cerambycidae as a subfamily, but are now treated as families based on work done by many researchers like Linsley (1961, 1962), Bense (1995), Svácha et al. (1997), San-Martín et al. (1997), Jenis (2001), Švácha and Lawrence (2014a, 2014b, 2014c).

**Family: Disteniidae Thomson, 1860**

**Subfamily: Disteniinae Thomson, 1860**

**Tribe: Cyrtonopini Gressitt, 1940**

**Cyrtonops** White 1853b: 32 (type sp.: *Cyrtonops punctipennis*) White 1853a; **Cladopalpus** Lansberge 1886: 35 (type sp.: *Cladopalpus hageni*) Lansberge 1886.

**Remark**

In the Latin grammar, names ending in *-ops* are neither masculine nor feminine. They must ‘be treated as masculine unless its author, when establishing the name, stated that it is feminine or treated it as feminine in combination with an adjectival species-group name’ (ICZN 1999, Art. 30.1.4.2). Since White (1853) did not choose a gender, *Cyrtonops* must be treated as masculine.

**1. *Cyrtonops niger* (Gahan 1906)**

*Cyrtonops niger* (Gahan 1906): 60, fig. 22 (♂) (Fauna), (m. s.).

**Type locality:** India: Manipur (ST ♂); BMNH.

**Distribution:** India (Northern India) and Myanmar.

## Discussion

Basically, the larvae of longhorn beetles are phytophagous and can inflict damages by acting as borers of sapwood or heart wood by feeding on bark or phloem, and acting as root borers or sometimes gall formers. Larvae are known to develop in dead wood, live woody plants (Disteniidae) or roots of trees and herbaceous plants (Vesperidae). Adults are known to girdle twigs or branches for feeding. Feeding on fermenting sap or fruits, pollen, nectar or fungal spores was also observed (Beeson 1941; Švácha and Lawrence 2014a).

With respect to longhorn beetles belonging to Cerambycidae, the checklist information for Vesperidae and Disteniidae is available for few neighbouring countries of India. Eighty-six species of longhorns including Vesperidae (1), Cerambycidae: Prioninae (9), Lepturinae (1) and Cerambycinae (75) with information on their host plants and distributions were reported from Sri Lanka (Makihara et al. 2008).

Disteniidae currently contains over 300 species in four tribes. It is a widely distributed, predominantly tropical and subtropical family, absent from New Zealand and Australia, with only a few species penetrating into temperate areas (Švácha and Lawrence 2014b). In the current study, a total of 12 species three tribes of Disteniidae were documented from India.

Philinae is predominantly an Oriental group, while Anoplodermatinae is Neotropical (Švácha and Lawrence 2014c). In the present report, three species belonging to Philinae were documented from India.
